

Value led problem statement

African communities, educators, students, researchers, and younger generations are increasingly affected by the gradual loss of traditional folktales as oral storytelling declines and many stories remain undocumented or inaccessible in digital formats. This threatens cultural identity, indigenous knowledge, and the moral values embedded in these narratives. Our team aims to address this challenge by developing an AI-powered, domain-specific language model that preserves, organizes, and generates authentic African folktales while respecting their cultural context. Guided by the values of cultural preservation, inclusivity, fairness, transparency, and responsible AI, our solution will prioritize accurate representation of diverse traditions and avoid cultural bias or misrepresentation. We hope to make African folktales more accessible for education, research, and creative exploration, helping preserve cultural heritage and inspire future generations to learn from and celebrate Africa's rich storytelling traditions.
